Amazon Kendra releases GitHub SaaS Connector

Posted On: Jun 2, 2022

Amazon Kendra is an intelligent search service powered by machine learning, enabling organizations to provide relevant information to customers and employees, when they need it. Starting today, AWS customers can use the Amazon Kendra Github SaaS connector to index and search documents from GitHub Enterprise Cloud data source.

Many organizations use GitHub as a code hosting platform for version control and to redefine collaboration of open-source software projects. A GitHub account repository can include many content types, such as files, issues, issue comments, issue comment attachments, pull requests, pull request comments, pull request comment attachments, and more. This corpus data is scattered across multiple locations and content repositories (public, private, and internal) within an organization. Organizations can now use the Github SaaS connector to index these documents and provide search results and answers to their users about this project content using Amazon Kendra intelligent search.

The Amazon Kendra Github SaaS connector is available in all AWS regions where Amazon Kendra is available. To learn more about these connectors, visit the documentation page or the Amazon Kendra connector library. To explore Amazon Kendra, visit the Amazon Kendra website.
